- b. If the highest frequency of the internal sources of the EUT is less than 108 MHz, the measurement shall only be made up to 1 GHz.
- c. If the highest frequency of the internal sources of the EUT is between 108 MHz and 500 MHz, the measurement shall only be made up to 2 GHz.
- d. If the highest frequency of the internal sources of the EUT is between 500 MHz, and 1 GHz, the measurement shall only be made up to 5 GHz.

IP Conformance Test Cases for RFCs

The Appendix-I consist of 11 tables, from Table -1 to Table - 11

**Table-1: OSPFv2 as per RFC 2328**  
**Parameter Group: IP Conformance (CONFIP)**

<b>RFC Section</b>	<b>RFC Clause</b>	<b>Remarks</b>
9.2	First, a Hello Packet may be received from a neighbour claiming to be itself the Backup Designated Router. Alternatively, a Hello packet may be received from a neighbour claiming to be itself the Designated Router, and indicating that there is no Backup Designated Router. In either case there must be bidirectional communication with the neighbour, i.e., the router must also appear in the neighbour's Hello Packet. This event signals an end to the Waiting state.	
13(5b)	In some cases (e.g., the state of the receiving interface is DR and the LSA was received from a router other than the Backup DR) the LSA will be flooded back out the receiving interface	
13.5	Circumstances:- LSA is more recent than database copy, but was not flooded back out receiving interface. Backup:- Delayed acknowledgment sent if advertisement received from Designated Router, otherwise do nothing. All other States:- Delayed acknowledgment sent.	
13(5a)	If there is already a database copy, and if the database copy was received via flooding and installed less than MinLSArrival seconds ago, discard the new LSA (without acknowledging it) and examine the next LSA (if any) listed in the Link State Update packet.	
8.1 & 8.2	The OSPF packet header is verified. The fields specified in the header must match those configured for the receiving interface. If they do not, the packet should be discarded	

**Note: Wherever a particular IP test is implemented in a product through a RFC different from what is mentioned in ER, please obtain confirmation from Helpdesk before submitting application.**

**Table-2: OSPFv3 as per RFC 2740**  
**Parameter Group: IP Conformance (CONFIP)**

<b>RFC Section</b>	<b>RFC Clause</b>	<b>Remarks</b>
3.1.3	The Interface ID that the neighbour advertises in its Hello Packets must be recorded in the neighbour structure. The router will include the neighbour's Interface ID in the router's router-LSA when either a) advertising a point-to-point link to the neighbour or b) advertising a link to a network where the neighbour has become Designated Router.	
A.3.2	All routers connected to a common link must agree on certain parameters (HelloInterval and RouterDeadInterval). These parameters are included in Hello packets, so that differences can inhibit the forming of neighbour relationships. The Hello packet also contains fields used in Designated Router election (Designated Router ID and Backup Designated Router ID), and fields used to detect bi-directionality (the Router IDs of all neighbours whose Hellos have been recently received).	
3.2.2	The receiving router must be an area border router, and the Router ID specified in the packet (the source router) must be the other end of a configured virtual link. The receiving interface must also attach to the virtual link's configured Transit area. If all of these checks succeed, the packet is accepted and is from now on associated with the virtual link (and the backbone area).	
3.2.2	The fields specified in the header must match those configured for the receiving interface. If they do not, the packet should be discarded	
3.4.3.1	Consider the router-LSA that router RT3 would originate for Area 1 in Figure 1. Only a single interface must be described, namely that which connects to the transit network N3. It assumes that RT4 has been elected Designated Router of Network N3

**Table-3: IPV6 as per RFC 2460**  
**Parameter Group: IP Conformance (CONFIP)**

<b>RFC Section</b>	<b>RFC Clause</b>	<b>Remarks</b>
4.1	IPv6 nodes must accept and attempt to process extension headers in any order and occurring any number of times in the same packet,	
4.2	The Option Type identifiers are internally encoded such that their highest-order two bits specify the action that must be taken if the processing IPv6 node does not recognize the Option Type:  11 - discard the packet and, only if the packet's Destination Address was not a multicast address, send an ICMP Parameter Problem, Code 2, message to the packet's Source Address, pointing to the unrecognized Option Type.	
4.2	The Option Type identifiers are internally encoded such that their highest-order two bits specify the action that must be taken if the processing IPv6 node does not recognize the Option Type:  01 - discard the packet.	
4.2	The Option Type identifiers are internally encoded such that their highest-order two bits specify the action that must be taken if the processing IPv6 node does not recognize the Option Type:  10 - discard the packet and, regardless of whether or not the packet's Destination Address was a multicast address, send an ICMP Parameter Problem, Code 2, message to the packet's Source Address, pointing to the unrecognized Option Type.	
4.4	If Segments Left is zero, the node must ignore the Routing header and proceed to process the next header in the packet, whose type is identified by the Next Header field in the Routing header.

6.1.2	A node MUST silently discard any received Router Advertisement messages that do not satisfy all of the following validity checks: <ul style="list-style-type: none"> <li>- The IP Hop Limit field has a value of 255, i.e., the packet could not possibly have been forwarded by a router.</li> </ul>

**Table-5: IPV6 as per RFC 4862**  
**Parameter Group: IP Conformance (CONFIP)**

<b>RFC Section</b>	<b>RFC Clause</b>	<b>Remarks</b>
5.4.2	In order to improve the robustness of the Duplicate Address Detection algorithm, an interface <b>MUST</b> receive and process datagrams sent to the all-nodes multicast address or solicited-node multicast address of the tentative address during the delay period. This does not necessarily conflict with the requirement that joining the multicast group be delayed.	
5.4	Duplicate Address Detection <b>MUST NOT</b> be performed on anycast addresses (note that anycast addresses cannot syntactically be distinguished from unicast addresses).	
7.1.1	A node <b>MUST</b> silently discard any received Neighbour Solicitation messages that do not satisfy all of the following validity checks:  <ul style="list-style-type: none"> <li>- The IP Hop Limit field has a value of 255, i.e., the packet could not possibly have been forwarded by a router.</li> </ul>	
7.1.1	The contents of the Reserved field, and of any unrecognized options, <b>MUST</b> be ignored. Future, backward-compatible changes to the protocol may specify the contents of the Reserved field or add new options; backward-incompatible changes may use different Code values.	
7.1.2	A node <b>MUST</b> silently discard any received Neighbour Advertisement messages that do not satisfy all of the following validity checks:  <ul style="list-style-type: none"> <li>- The IP Hop Limit field has a value of 255, i.e., the packet could not possibly have been forwarded by a router.</li> </ul>

**Table-6: IPV6 as per RFC 1981**  
**Parameter Group: IP Conformance (CONFIP)**

<b>RFC Section</b>	<b>RFC Clause</b>	<b>Remarks</b>
4	A node may receive a Packet Too Big message reporting anext-hop MTU that is less than the IPv6 minimum link MTU. In thatcase, the node is not required to reduce the size of subsequentpackets sent on the path to less than the IPv6 minimum link MTU,

**Table-7: IPV6 as per RFC 4443**

Test Setup	 <p>The diagram illustrates the test setup for SNMPv2 functional tests. It shows a blue router icon on the left labeled "EUT Configured as Agent" with the IP address "1.1.1.1/24" below it. A horizontal line connects this router to a blue laptop icon on the right labeled "SNMP Test Tool" with the IP address "1.1.1.2/24" below it.</p>
Test Procedure	<ol style="list-style-type: none"><li>1. Configure the EUT to run SNMP agent and SNMP Test Tool (NMS) to run SNMP manager application by using correct parameters.</li><li>2. Testing of TRAP message: The NMS uses SNMPv2 to manage the SNMP agent, and the agent automatically sends notifications to report events to the NMS.</li><li>3. Configure the SNMP agent to send traps to the manager.</li><li>4. Use a wrong community name to get the value of a MIB node on the agent. You can see an authentication failure trap on the SNMP manager.</li><li>5. Test "SetRequest" operation: SNMP Testing node (SNMP manager) sends SNMPv2c "SetRequest" to set SysName to "EUT1". Verify the SysName value on the EUT. It should match the value "EUT1" set using 'SetRequest' function from the SNMP manger.</li><li>6. Test SNMP GET Operation (single Object): Testing node (SNMP Manager) sends SNMPv2c "GetRequest" scalar object to get sysName.0 1.3.6.1.2.1.1.5.0 in system group in MIB II, to Agent. The agent should respond with "SysName value as "EUT1" as set in the previous step, verifying that the EUT support SNMP GET function.</li></ol>
Expected Results	<ol style="list-style-type: none"><li>1. TRAP should be sent by EUT (Agent) to Testing Node (SNMP Manager).</li><li>2. SetRequest operation should be able to set SysName object in agent (EUT)</li><li>3. GetRequest operation should be able to get SysName Object from agent (EUT)</li><li>4. Attach screenshots for above successful operations.</li></ol>
